# Delete or split SAP HANA database clones after upgrading SnapCenter

After upgrading to SnapCenter 4.3, you will no longer see the clones. You can delete the clone or split the clones from the Topology page of the resource from which the clones were created.

## About this task

If you want to locate the storage footprint of the hidden clones, run the following command: `Get-SmClone -ListStorageFootprint`

## Steps

1. Delete the backups of the cloned resources by using the `remove-smbbackup` cmdlet.
2. Delete the resource group of the cloned resources by using the `remove-smresourcegroup` cmdlet.
3. Remove the protection of the cloned resource by using the `remove-smprotectresource` cmdlet.
4. Select the parent resource from the **Resources** page.

The resource topology page is displayed.

5. From the **Manage Copies** view, select the clones either from the primary or secondary (mirrored or replicated) storage systems.
6. Select the clones, and then click  to delete clones or click  to split the clones.
7. Click **OK**.
